# Friday worksheet: evidence, curves and an AI answer

IIT414W | 25 September 2026 | Short answers are enough | No grade

**YOUR ROUTE** Complete **A at 11:10** and **B at 12:25**. **Hand in this sheet on paper at 13:40.** Submit the separate Friday Exit Ticket in Canvas by **13:40** for the Certamen 1 bonus opportunity.

## A. From the F1 result to a new prediction | 11:10-11:20

**Remember:** A **fact** has already happened and can be checked. A **prediction** concerns a future event and may be wrong. Example: “Ferrari scored 20 and McLaren 41 in Italy + Spain” is a fact. “McLaren will score more in Baku” is a prediction.

**1.** Write the observed result. Which team scored more in Italy + Spain, and by how many points?

---

**2.** Does that result prove who will score more in Baku? Circle **YES / NO**. Give one short reason.

---

**3.** Name one new piece of information you would check before changing a future forecast.

---

**Keep Thursday's Baku and Sepang forecasts unchanged.** If you revise one later, add a new dated row.

## B. Check a claim made by AI | 12:25-12:35

**How to read the curves:** Horizontal = number of training rows. Vertical = accuracy. Training uses data the model saw; validation uses separate data. A gap is an **observation**; its cause is a **hypothesis**. Example: at 800 rows, Curve A has 65% training and 62% validation accuracy, a gap of **3 percentage points**. The curves are fictional and say nothing about Baku or Sepang.

**Use three checks: Form** - does it separate observation from advice? **Content** - does the graph support its claims? **Utility** - is the next check specific and safe?

> **AI says:** “Curve B has a persistent train-validation gap, so the model is overfitting. Increasing model complexity will fix it, and the 2023-2024 final test should be checked after every change.”

**4.** Underline the phrase the graph directly supports. Put a **?** next to “overfitting”: possible, not proven. Cross out the promised fix and the instruction to check the final test after every change.

**5.** At 800 rows, Curve B has **94% training** and **66% validation** accuracy. The gap is **_____ percentage points**.

**6.** Write two short sentences: first, the observation from 5; second, one check to do before changing the model (such as the validation split or data leakage). Do not use the final test repeatedly.

**Observation:**

---

**Next check:**

---

**BEFORE HANDING IN** A1-A3 [ ] AI answer marked [ ] gap calculated [ ] two sentences [ ]
